Lab Activity

Data Representation - Exercises

Signed Numbers

- CB, Chapter 2, Exercise 24 - Using a "word" of 3 bits, list all the possible signed binary numbers and their decimal equivalents that are representable in:

    a) Signed magnitude

    b) One's complement

    c) Two's complement

- CB, Chapter 2, Exercise 25 – repeat the previous question using a "word" of 4 bits

- CB, Chapter 2, Exercise 26 - From the results of the previous two questions, generalize the range of values (in decimal) that can be represented in any given x number of bits the three number representations.

Example: Using IEEE 754 Floating Point Standard
half-precision binary floating point

- IEEE 754 *half-precision binary floating point* (or binary16 for short) uses 5 bits for exponents => we get a 15 bias
  - Can represent any exponent between -15 and 16
- Uses10 bits to the binary fraction
Floating Point Numbers

- Convert 100.25_{10} to IEEE 754 *half-precision binary floating point*

- Convert 1010011010000000 in IEEE 754 *half-precision binary floating point* representation to a decimal number
